JAYDEN ALONZO-ESTRADA

AI Engineering, Cybersecurity, and Linux Systems

Grand Junction, Colorado | 808-491-5116 | jayden.alonzoestrada@gmail.com | j2a3e.com | linkedin.com/in/jayae

TECHNICAL SKILLS

AI Agent Orchestration	Python, C, TypeScript, React	Linux System Administration	PostgreSQL & Web Servers
REST APIs & Backend Services	Git, GitHub CI/CD & Releases	Zero Trust, PCI & HIPAA	SSH & Firewall Hardening
Stripe, Square, Authorize.net	Test & Eval Automation	MCP Servers & Tools	Project & Customer Coordination

PROFESSIONAL EXPERIENCE

AI Engineer, EggNest.ai, Grand Junction, CO **Sep 2026 - Present**

- Promoted from AI Services Intern after leading connector delivery for a year into a Service Delivery role spanning software engineering, customer implementation, data integration, and operational reliability; approved to run customer communications directly and provision VMs for customer deployments.
- Build and support customer data connectors for DealCloud, Ajera, Panzura, and QuickBooks Online that authenticate against customer systems, transform records into EggNest formats, and handle pagination, retries, rate limits, and interrupted runs; brought a DealCloud connector to customer-testing readiness and moved an Ajera connector into customer testing while developing Panzura.
- Standardized Docker-based one-command deploy bundles across every connector repo (Panzura, QuickBooks Online, DealCloud, Ajera) with 10 merged PRs, ran parallel engineer agents with a dedicated reviewer across five repos for one rollout, and tested bundles end to end on client VMs, fixing container UID mismatches and PII-redaction gaps in probe scripts.
- Contribute to the ConnectorLib framework rollout that standardizes connector structure, lifecycle, restart-safe execution, deployment bundles, and configuration and secret handling, and enforce clear dev/production separation, access defined before rollout, roles drawn from authoritative records, and secrets kept out of code.
- Shipped EggNest Portal features through staging: Gremlin Tracker for recurring operational issues, a Budget Watch notifier, admin impersonation, time attribution, timecard accuracy modeled on logged hours, OWL risk reporting, and GitHub App issue-filing error handling; 74 commits and 14,500+ lines across 145 files in 9 working days (Sep 2026), with 28 of 31 sessions fully or mostly meeting goal.
- Ran database operations on the dev and staging environments (pending migrations, admin grants, user verification, and misconfigured-environment diagnosis), confirming each change with follow-up queries; triaged and merged 14 Dependabot PRs and recovered staging after a breaking argon2 upgrade.
- Coordinate customer projects end to end in Productive and HubSpot: source-system requirements, field mapping, test timelines, readiness milestones, issue prioritization, and rollout scope across Service Delivery, engineering, and customers; hold the company seat on the OpenAI Partner Portal.
- Built the team's multi-agent Claude Code environment (tailored agent roles, hooks, an SSH rulebook, and a distributable issue-burndown skill) and consolidated org and personal skills into one verified plugin.

AI Services Intern, EggNest.ai, Grand Junction, CO **Oct 2025 - Sep 2026**

- Evolved the HubSpot connector into a deep CRM integration covering 11 object types (contacts, deals, tickets, meetings, notes) with write actions and UAT agents so Glean can both inspect and act on records, and enriched 92 HubSpot property descriptions with drift-regression guards.
- Took a customer Zoho Desk connector from foundation to customer-driven production: sync model, support-ticket indexing, custom-field auto-discovery across record types, task-scoped documents, and URL-resolution fixes.
- Built and hardened connectors for Deltek Vantagepoint, DealCloud, and Paylocity/Kinective, researching each vendor API and building a credential validator before scaffolding code; root-caused indexing gaps to duplicate view_url deduplication and a missing Account facet.
- Ran audit-to-burndown pipelines as custom slash commands (/audit-issues, /draft-issue, /issue-burndown, /repo-factory) with agent teams in defined roles: verified every CodeQL finding against the codebase before filing 12 issues and 2 epics, triaged 31 issues, and merged 10 PRs closing all 9 targets; 158 commits, 25,900+ lines, and 562 files across 21 working days (Jul to Sep 2026), with 29 of 31 sessions fully or mostly meeting goal.
- Stood up connector repositories for Vitally and Ajera/Glean through a repo-factory workflow (project boards, labels, scaffold epics, and ADRs justifying per-product repo splits), shipped a connector with 225 passing tests and an approved agent review, and verified Panzura deployment feasibility against the codebase before cutting a customer branch.
- Standardized org-wide connector development by packaging repeatable workflows as shared ConnectorLib skills (sync-readme, audit-issues, release-making, draft-commits, clear-datasource), including a sync-readme skill that proves every README and runbook claim against HEAD before merge.
- Administered the Linux servers and databases behind the EggNest Portal and its connector services: redeployed connector Lambdas after merges, managed dev-database accounts (flagging elevated admin roles), and prepared production database migrations with schema diffing.
- Shipped timecard and scheduling platform features on the Deltek Vantagepoint integration: multi-manager scheduling, audience groups, time-card UAT fixes, consolidation of duplicated scheduling wizards, role-based routing, feature-flag admin pages, and accessibility hardening verified in Playwright.
- Drafted the company's HIPAA/PII compliance roadmap against its existing BAA/DPA commitments and prepared Google OAuth verification with narrowed calendar scopes and a privacy route.

Software Developer (Independent Contractor), Rotary Club of Grand Junction, Grand Junction, CO **Nov 2024 - Present**

- Rebuilt the club's Snowball Sweepstakes platform from scratch in three weeks (July 2026) on Next.js, TypeScript, Vercel, and Neon Postgres with a typed, migration-managed schema, replacing a 2020 student build on unpatched Node.js 10; migrated all 38 charities, 5 sponsors, staff accounts, and historical ticket records intact.
- Closed the old site's security failures: scrubbed live database, payment-gateway, and admin credentials from git history, retired 689 buyer accounts whose login never verified passwords in favor of throttled admin authentication with per-page authorization checks, and made tickets issue only from signature-verified, duplicate-proof payment webhooks.
- Built a switchable payment-provider abstraction across Stripe, Authorize.net, and Square, plus a cheapest-combination bundle-pricing algorithm, tiered sponsorships, unique-pair drawings, protected CSV and Excel exports, and per-charity and per-seller revenue reporting.
- Gated every deployment on 96+ automated tests and Playwright browser verification, live-verified Authorize.net payments before launch, fixed nine findings from a pre-launch security audit, moved all imagery to a CDN with a non-destructive crop editor, and added in-place page editing so admins change content without a developer.
- Made the club self-sufficient under an hourly maintenance contract: a training mode on a separate practice database, self-service member accounts with email verification and role management behind a permanent-admin allowlist, a backed-up production data wipe for season reset, and a written rebuild rationale plus itemized invoices for the board.

Field Technician, Greenflare Technologies, Denver, CO **Oct 2024 - Sep 2026**

- Repaired and maintained high-throughput Linux compute systems in production, restoring failed nodes and improving hardware uptime.
- Diagnosed Ethernet bottlenecks with packet captures and targeted load tests, boosting network throughput by ~20% in high-traffic areas.

Software Engineering Intern, JGMS Government Services, Grand Junction, CO **Jun 2025 - Aug 2025**

- Shipped and operated an internal RAG web framework service on Linux (FastAPI/Uvicorn, LangChain, Supabase PostgreSQL, and React), reducing document lookup by ~3 hours/week through natural-language dissemination and embedding-based retrieval.
- Implemented retrieval evaluation and logging to track top-k accuracy and latency, enabling iterative quality improvements through 2-week feature sprints within an 8-week delivery window.

Software Engineering Intern, Fiore Industries, Albuquerque, NM **Jun 2024 - Aug 2024**

- Delivered a working RF-to-optical testing protocol and pipeline in 2 weeks using MPLAB and low-level C, automating signal sweeps and data capture for component validation of mission-critical equipment.

Student Research Head, Colorado Mesa University, Grand Junction, CO **Dec 2023 - Present**

- Lead a 6-person team building machine learning pipelines for IoMT detection and small cybersecurity LMs; manage repos, sprints, code review, and experiment tracking for reproducibility.

LEADERSHIP EXPERIENCE

House Speaker, Associated Student Government, Colorado Mesa University **May 2026 - Present**

- Preside over the student House of Representatives, steering legislation from introduction through amendment, passage, or rejection while prioritizing communication between student government and the student body.

Treasurer, Society of Hispanic Professional Engineers (SHPE), CMU Chapter **Aug 2025 - Present**

- Manage the chapter's finances and budget in support of its professional development and outreach programming.

President, CMU Computer Science Club, Grand Junction, CO **Aug 2023 - Present**

- Built and operate a student high-performance, distributed-computing cluster on Linux, provisioning nodes and managing user access to support coursework, experiments, and competition practice.
- Coached multiple competitive coding teams to national events with average top-10 placements.

President, CMU Cybersecurity Club, Grand Junction, CO **Aug 2023 - Present**

- Ran weekly hands-on labs for ~7 participants on topics like packet analysis and detection engineering to strengthen blue-team skills.

HONORS & FELLOWSHIPS

Springboard Fellow, Colorado Mesa University **Sep 2026 - Present**

- Selected for CMU's Springboard Fellowship, which pairs first-generation students with mentors from the Grand Junction professional community and brings the cohort to programming in Denver and Washington, D.C.

Thrive Scholar, Class of 2027: multi-year career program in quantitative analysis and communication **Jun 2022 - Present**

EDUCATION

B.S. Computer Science, Minor: Cybersecurity, Focus: AI Application, GPA: 3.63 **Aug 2023 - May 2027 (expected)**

Colorado Mesa University, Grand Junction, CO

- Captained coding and cybersecurity teams to multiple national competitions, achieving 4th in regional standings in the first year.
- Related coursework: Probability and Statistics, OOP & Design Patterns, Intro to Database, Intro to Algorithms, Python Machine Learning.

RESEARCH EXPERIENCE

The Effect of Increased Dimensionality on Detecting Malicious IoMT Network Traffic **Dec 2023 - Mar 2025**

- Research Lead and Author; published by Springer and presented at MobiSec 2025 in Sapporo, Japan (with A. Mora, A. Avila, and R. Basnet).

- Engineered flow-based features and trained ML models to classify IoMT traffic, benchmarking six models across packet-level (DPKT) and flow-level (CICFlowMeter) feature sets on the CICIoMT2024 dataset.

Exploring Agentic Misalignment in Commercial Level Applications **Sep 2025 - Present**

- Ongoing research developing best practices for using AI in business settings, geared toward non-technical stakeholders.

EXTRA-CURRICULAR ACTIVITIES

Mesa Catholic, Grand Junction, CO: property cleanups with elderly community members **Jun 2025 - Aug 2025**

Mount Garfield Middle School, Clifton, CO: STEM volunteer teaching network visualization basics **Nov 2024**

MATHCOUNTS Colorado, Grand Junction, CO: volunteer judge for scoring and logistics **Feb 2024**
